

Project Design Phase-Part 2

Cloud Deployment

Date	03 November 2023
Team ID	NM2023TMID02713
Project Name	Create a Google business profile

Cloud Deployment :

Explanation :

GCP is a public cloud vendor that offers a suite of computing services to do everything from data management to delivering web and video over the web to AI and machine learning tools.

Customers are able to access computer resources housed in Google's data centers around the world for free or on a pay-per-use basis.

Google Cloud offers pre-defined templates that you can use to deploy common solutions with Deployment Manager. These templates are offered as part of Google Cloud Marketplace and can be found in the Google Cloud console.

The advantage of Google Cloud Marketplace is that it handles configuration and template creation for you and you just deploy the solution through a button in the Google Cloud console. This greatly simplifies creating deployments on Deployment Manager.

Google Cloud Marketplace offers some level of customization for these solutions; however, for advanced users who need full control over your configurations or want to do a high level of customization, you might need to create your own configuration.
